

Embedded C and Microcontroller programming - Assignment 01

1. check nth bit of register
2. set nth bit of register
3. clear nth bit of register
4. toggle nth bit of register
5. set bits 12 to 15 of register
6. clear bits 17 to 20 of register
7. check number is even or odd
8. check number is divisible by 2
9. swap two number
10. read value from bit 19 to 24 of register
11. write value on bit 8 to 15 of register
12. wait while bit 4 of register is 0
13. wait while bit 4 of register is 1
14. Write a menu driven program to basic arithmetic operations. Write separate function to perform each operation and use array of function pointers to store their addresses and call them using those pointers. Also use typedef to make your program more readable.
15. Turn on all LEDs one by one in a sequence and turn off in opposite sequence. (use some delay)
